### **Inception Review for Team 7**

<b>Finder</b>	<b>Severity [major, minor, open issue]</b>	<b>Kind [missing, extra, wrong]</b>	<b>Defect Type</b>	<b>Description</b>	<b>Suggested Feedback</b>
Team 6 - Hannah	Minor	Missing	Description	There wasn't much elaboration on the Pomodoro method and the benefits of it/why users would want to use this.	I wish in the presentation, there was more explanation and background behind what the pomodoro method is and why/how it is beneficial.
Team 6 - Hannah	Open issue	Missing	Functionality	Since the deliverable says that users will set their timers manually, how will you make sure that the timer is running correctly and the time not messing up due to user error?	Is there a way to make it to where users won't have to do everything manually and the website will have more automatic features?

Team 6 - Puskar	Open issue	Missing	Functionality	How would you implement do not disturb mode in a webapp? Will there be an option to turn off Do Not disturb feature while using the app if the user does not want to mute notifications while using the app	If users can select to turn/off the do not disturb mode will be good. Also, if yall could provide an option for users to select which notification to mute and which not, would be plus point.
Team 6 - Puskar	Open issue	Missing	Functionality	How will the app provide break activity suggestions? Does the user have to input that information?	Ask the user for activities they are likely to involve during breaks?
Team 6 - Hannah	Major	Missing	Design Defect	I think the UI Example you have so far looks pretty crowded with every category on one screen. This might make the app less user-friendly and since the app is for people who want to relax due to stress and escape work, it might be better to display a UI that isn't too busy.	Maybe you could create a dashboard, since it will be a web application, and you could put the different navigations on there.
Team 6 - Hannah	Open issue	Extra	Functionality	I know you said that what makes you different from other pomodoro trackers is that you will display user stats, but what will the user need the stats for? Are the user stats necessary for using the app or is it just simply for if the user is curious about that info?	Maybe you could incorporate suggestions for how the user can improve their schedule in their future, how to relax, etc. based on their user stats.

Team 6 - Safi	Minor	Extra	functionality	For the do not disturb feature, you can't block notifications from a web app. You would need root privileges and even then it would be a hassle.	I would suggest just not including this feature. This is a feature that i have not seen in a single web application and it most likely won't get accomplished by the end of the semester.
